<u>**CS 419 Winter, 2016**</u>
Group 18 Weekly Progress Report 1

Jennifer Erland
Charles Hardes
Ty Hatton
Jason Murray

o Progress during the past week:

The actions this week has produced a design document for the fuel price visualizer with a series of milestones. The design document included as much detail as was available to us regarding the overall trajectory of producing the product.

The first iteration of the product has been completed. This includes allowing the user to launch the application and view the home page. From the home page, the user can select the map page and view prices of regular gas for each zip code by hovering over a zip code region on the map.

o Plans for the upcoming week:

Next week, the plans are to implement the first rounds of testing and refining the map page. Categorization of problems encountered will be considered depending upon issue scope and nature. The first rounds of testing the home page and preliminary styling layouts are also slated for tentative action this coming week.

o Any problems you encountered during the past week:

The problems encountered this past week were limited. With the first product released in the latter part of the week, initial testing indicates various issues with loading speed and compatibility with mobile devices. These issues are to be examined during the upcoming week.
